Abstract:

Ever found it awkward to go to a restaurant alone? Or have you been not able to order your favourite food because the quantity is more for a single person? Not to worry, Tinder for food is here to crack this problem.

Tinder for food is Web App which mainly aims to reduce food wasted in restaurants by people who couldn't finish eating the food they ordered completely. The App connects people who are alone in the restaurants with mutual food interests so that they can order food together and share it. In this way the food wasted by both the parties can be saved. We are mainly targeting College students, Travelers and Working people staying away from home.

Technologies used:

- MERN Stack
- Geolocation API

Working:

- Search for the restaurant and enter the room created for that restaurant.
- A dialog box appears where you enter your food interests .Ex: Veg, non-Veg, etc
- We connect you with people with similar food interests. There is a chat option where you can communicate with other person about what you want to order.
